```
List 成员: int* m_list int m_size int m_length
                (就為: void foreach In Range (int head, int tail, void (*func)() 重载 void (*func)(int num))
void foreach In Range Reverse ···
void back Move (int id-1, int id-2); // 用前头 if-full
                                void front More [int id_1 ; int id=2);
                                int* begin ():
                                int* end();
                         海馬斯勒: List(): m_size(1){m_list=malloc(INTSIZE * m_size);}
List(int size): m_size(size){m_list=malloc(INTSIZE* m_size);}
                                               List (int size.int num): m_size(size) {m_list=malloc(INTSIZE* m_size);

Foreach InRange (Begin(), End(), ...);}
                                               "List() { free (m-list);}
                                操作法: 增: boolInsert (int id, int num); //if-full(); BackMove(id); *(m_size + id) = num
                                             Att): void Delete (int id); 1/ Front Move (id);
                                                   void Deletel); //~List();
                                              说: void Enchange (int id-1, int.id-2); // 昭
                                                    void Change (int id, int num); // 25
                                              重: int Search By Id (int id); 11 图名
                                                    vector Search By Num (int num); // Foreach In Range (0, length, []() \ifti if (-==-) return; }
                                               斯 bool if-full();
                                                     bool if_empty();
                                                     int size();
                                                     int length();
                                               社会
                                            friend ostream & operator << (List);
friend istream & operator >> (List);
```
